The Ultherapy[®] treatment is the only non-invasive procedure cleared by the U.S. FDA to lift the skin on the neck, under the chin, and on the brow, as well as to improve the appearance of lines and wrinkles on the décolleté.³

Ultherapy[®] uses time-tested ultrasound energy to lift and tighten the skin naturally without surgery, helping you achieve a fresher, more youthful look from your brow to your chest!

- Non-invasive
- Minimal to no downtime
- Builds collagen
- Natural results
- Single treatment
- Good safety profile

Works Naturally
from the Inside Out

Ultherapy[®]

Get a Lift and Don't Settle for Less

The Ultherapy® non-invasive lift procedure delivers focused ultrasound energy to the same foundational layer typically addressed by surgeons during cosmetic surgery without cutting or disrupting the surface of the skin.^{1,2}

Not All Ultrasound Treatments are Created Equal

Ultherapy® is the only non-invasive skin lifting ultrasound treatment that went through rigorous assessments and clearance by the US FDA. The product is indicated for lifting the eyebrow, neck and under the chin as well as improves wrinkles on the chest area (décolletage).³

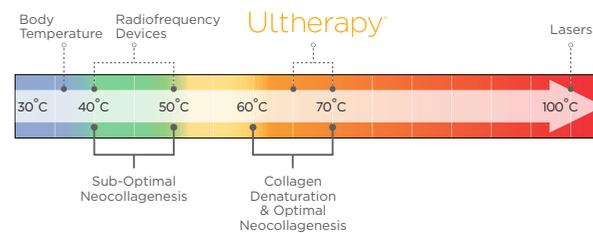

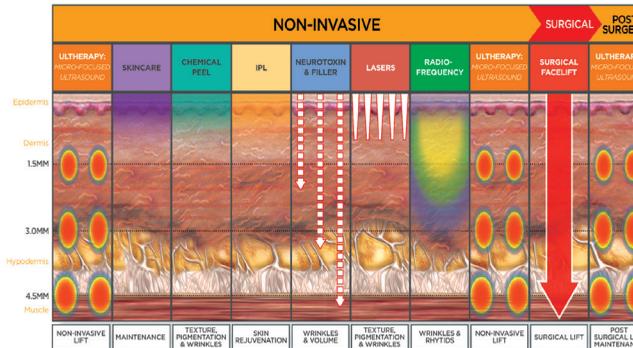

“See and Treat”

The importance of “seeing while treating” in real time was recognized by US FDA when Ultherapy® received clearance in 2013 for the use of its imaging to visualize the dermal and subdermal layers of tissue. This imaging is necessary to ensure proper contact with the skin and confirm the appropriate depth of treatment, such as to avoid bone.³

Depths Matter

At 3.0mm beneath our facial skin surface, lies the dermis layer that is inherently rich in collagen. At 4.5mm depth, lies the superficial muscle layer of the face (SMAS) which is usually addressed during facial cosmetic surgery. Ultherapy® treatment has been designed to accurately and consistently target 3.0mm and 4.5mm depth at optimal temperature of at least 60°C to create effective collagen regeneration and sustainable lifting effect on your skin naturally and non-invasively.^{4,5,6}

Ultherapy consistently heats tissue to 60°-70°C, the optimal temperature range for stimulating new collagen growth, or neocollagenesis.⁷
